

The OraStretch™ Press

Jaw Motion Rehab System

Trismus * Radiation Fibrosis * TMJD * "Lockjaw"

Increase jaw range-of-motion

The **OraStretch™** Press jaw rehab system is a handheld passive motion device designed for the prevention and treatment of trismus, scarring, surgical rehabilitation, pain and joint dysfunction.

The **OraStretch** press moves along the natural anatomical motion of the jaw for easy, safe rehabilitation. It has adjustable safety limits for control and to prevent overstretching.

The **OraStretch** press provides therapy for patients to a fully functional 50mm range-of-motion. It is small, lightweight and ergonomic for easy carrying and use throughout the day.

The **OraStretch** press has an intuitive design--simply squeeze the handles to stretch the jaw--and an easy-to-read side scale. Edentulous pads are available for patients missing teeth; and we carry the TheraBite Pediatric System for patients under 10-years-old.

CMR, Inc. specializes in jaw and head/neck rehab products. We bill insurance, file first-level appeals, and do not require full payment up-front*.

Indications

- Radiation therapy fibrosis
- Surgical Rehabilitation
- TMJD, clenching/grinding
- Arthritis, scleroderma, and stroke
- Trauma
